

WHAT IS CLAIMED IS:

1. A printing system including a plurality of data processing devices and a plurality of printing devices for executing a printing operation when received a printing job signal from any one of the plurality of data processing devices, respectively, comprising:

communication means for communicating data among the plurality of printing devices;

10 printing means provided in each of the plurality of printing devices for executing a print job based on the print job signal; and

a controller for executing the following processings;

grouping the plurality of printing devices based on processing languages employed in respective printing devices,

designating a managing printing device among the printing devices belonging to the same language group,

transmitting a status signal from each of the printing devices belonging to the same language group to the 20 designated managing printing device through the communication means; and

transferring a printing job signal received by a printing device being inoperative to execute a print job to another one of the printing devices of the same language group to which the inoperative printing device belongs.

2. A printing system according to claim 1, wherein the managing printing device provides with a first storage means for storing data regarding other printing devices belonging to the same language group,

5 each of the other printing devices provides with a second storage means for storing information regarding the managing printing device of the same language group, and

10 said controller executes the following processings:

10 transmitting the processing language and data processing capability of each of the plurality of printing devices to all other printing devices,

15 grouping the plurality of printing devices based on processing languages employed in respective printing devices,

15 designating a printing device having the highest data processing capability in the same language group as the managing printing device,

20 making the designated managing printing device store information about all other printing devices belonging to the same language group into said first storage means, and

25 making each of all printing devices other than the managing printing device belonging to the same language group store information about the managing printing device into each second storage means.

3. A printing system according to claim 2, wherein the controller selects a printing device to which the managing printing device has to distribute the printing job signal based on the data processing capability.

4. A printing system including a plurality of data processing devices and a plurality of printing devices for executing a printing operation when received a printing job signal from any one of the plurality of data processing devices, respectively, comprising:

communication means for communicating data among the plurality of printing devices;

printing means provided in each of the plurality of printing devices for executing a print job based on the print job signal; and

a controller for executing the following processings; grouping the plurality of printing devices based on processing languages employed in respective printing devices,

designating a printing device capable of processing different languages in the plural language groups,

transmitting a status signal from each of the printing devices belonging to the same language group to the managing printing device through the communication means;

and

transferring a printing job signal received by a printing device being inoperative to execute a print job to another one of the printing devices of the same language group to which the inoperative printing device belongs.

5

5. A printing system according to claim 4, wherein the managing printing device provides with a first storage means for storing information regarding other printing devices belonging to the same language group,

10

each of the other printing devices provides with a second storage means for storing data regarding the managing printing device of the same language group, and said controller executes the following processings:

15

transmitting the processing language and data processing capability of each of the plurality of printing devices to all other printing devices,

20

grouping the plurality of printing devices based on processing languages employed in respective printing devices,

designating a printing device having the highest data processing capability in the same language group as the managing printing device,

25

making the designated managing printing device store information about all other printing devices belonging to

DRAFTED IN JAPANESE

the same language group into said first storage means, and
making each of all printing devices other than the
managing printing device belonging to the same language
group store information about the managing printing device
5 into each second storage means.

6. A printing system according to claim 5, wherein
the controller selects a printing device to which the
managing printing device has to distribute the printing job
10 signal based on the data processing capability.

7. A printing system including a plurality of data
processing devices and a plurality of printing devices for
executing a printing operation when received a printing job
15 signal from any one of the plurality of data processing
devices, respectively, comprising:

communication means for communicating data among the
plurality of printing devices;
printing means provided in each of the plurality of
20 printing devices for executing a print job based on the
print job signal; and

a controller for executing the following processings;
grouping the plurality of printing devices based on
processing languages employed in respective printing
25 devices,

designating either one of the printing devices belonging to the same language group or one printing device belonging to plural language groups as a managing printing device;

5 transmitting individual status signals from all printing devices belonging to the same language group to the managing printing device through the communication means; and

10 transferring a printing job signal received by a printing device being inoperative to execute a print job to another one of the printing devices of the same language group to which the inoperative printing device belongs.

8. A printing system according to claim 7, wherein
15 the managing printing device provides with a first storage means for storing information regarding other printing devices belonging to the same language group,

20 each of the other printing devices provides with a second storage means for storing information regarding the managing printing device of the same language group, and

 said controller executes the following processings:

 transmitting the processing language and data processing capability of each of the plurality of printing devices to all other printing devices,

25 grouping the plurality of printing devices based on

DRAFT - PROVISIONAL

processing languages employed in respective printing devices,

designating a printing device having the highest data processing capability in the same language group as the managing printing device,

5. making the designated managing printing device store information about all other printing devices belonging to the same language group into said first storage means, and
making each of all printing devices other than the managing printing device belonging to the same language group store information about the managing printing device into each second storage means.

9. A printing device for executing a printing operation when received a printing job signal from any one of plural data processing devices comprising:

15 printing means for executing a print job based on the printing job signal;

communication means for communicating data between the printing device and other printing devices;

20 storage means for storing information about other printing devices having a processing language same as that of the printing device or a managing printing device managing the printing device; and

25 a controller for executing the following processings;

00000000000000000000000000000000

grouping other printing devices having a processing language same as that of the printing device;

5 communicating data regarding the processing language and data processing capability between other printing devices belonging to the same language group while comparing the data processing capability of the printing device with those of other printing devices;

10 if the printing device has the highest data processing capability, designating itself as a managing printing device and storing information regarding other printing devices belonging to the same language group into the storage means, and, if not, storing a printing device having the highest data processing capability among other printing devices as a managing printing device into the storage means; and

15 if the printing device itself is the managing printing device, selecting one printing device to which the print job signal is to be delivered upon receiving a request for a print job from one of other printing devices to deliver the print job signal to the selected printing device; and

20 if the printing device itself is inoperable to execute a print job, sending the request for a print job and the print job signal to the managing printing device.

25 10. A program product stored in a recording medium

executable by a computer for controlling a printing system including a plurality of data processing devices and a plurality of printing devices each of which executes a print job when received a print job signal, said program 5 product including a program for

grouping the plurality of printing devices based on processing languages employed in respective printing devices;

10 designating one of the printing devices belonging to the same processing language group as a managing printing device;

transmitting individual status signals from all other printing devices belonging to the same processing language group to the designated managing printing device; and

15 delivering a print job signal received by one printing device being inoperable to execute a print job to one of other printing devices belonging to the same processing language group.

20 11. A program product according to claim 10 wherein a processing language and data processing capability of each printing device are transmitted to all other printing devices,

25 all printing devices are grouped into one or more groups based on individual processing languages,

a printing device having the highest data processing capability among the printing devices belonging to the same processing language is assigned as a managing printing device;

5 the managing printing device stores information about all other printing devices belonging to the same processing language group; and
all other printing devices store information about the managing printing device, respectively.

10 12. A program product according to claim 11, wherein the managing printing device selects a printing device to which a print job signal is to be delivered based on respective data processing capability.

15 13. A program product stored in a recording medium executable by a computer for controlling a printing system including a plurality of data processing devices and a plurality of printing devices each of which executes a printing operation when received a print job signal, said 20 program product including a program for assigning a printing device belonging to plural processing language groups as a managing printing device; transmitting respective status signals from all other 25 printing devices belonging to each of the plural processing

language groups to the managing printing device; and
delivering a print job signal received by a printing
device which is inoperable to execute a print job to one of
other printing devices belonging to the same processing
language group.

5 14. A program product according to claim 13 wherein
each printing device transmits its processing language and
data processing capability to all other printing devices;
10 all printing devices are grouped into one or more
groups based on individual processing languages,

a printing device having the highest data processing
capability among the printing devices belonging to the same
processing language is assigned as a managing printing
15 device;

the managing printing device stores information about
all other printing devices belonging to the same processing
language group; and

20 all other printing devices store information about the
managing printing device, respectively.

15. A program product according to claim 14, wherein
the managing printing device selects a printing device to
which a job signal is to be delivered based on respective
25 data processing capability.

16. A program product stored in a recording medium executable by a computer for controlling a printing system including a plurality of data processing devices and a plurality of printing devices each of which executes a print job when received a print job signal, said program product including a program for grouping the plurality of printing devices based on processing languages employed in respective printing devices,

10 designating either one of the printing devices belonging to the same language group or one printing device belonging to plural language groups as a managing printing device;

15 transmitting individual status signals from all printing devices belonging to the same language group to the managing printing device; and

20 transferring a printing job signal received by a printing device being inoperative to execute a print job to another one of the printing devices of the same language group to which the inoperative printing device belongs.

17. A program product according to claim 16, wherein the managing printing device provides with a first storage means for storing information regarding other printing

25

SEARCHED 

devices belonging to the same language group,
each of the other printing devices provides with a
second storage means for storing information regarding the
managing printing device of the same language group, and
5 said controller executes the following processings:
transmitting the processing language and data
processing capability of each of the plurality of printing
devices to all other printing devices,
10 grouping the plurality of printing devices based on
processing languages employed in respective printing
devices,
designating a printing device having the highest data
processing capability in the same language group as the
managing printing device,
15 making the designated managing printing device store
information about all other printing devices belonging to
the same language group into said first storage means, and
making each of all printing devices other than the
managing printing device belonging to the same language
20 group store information about the managing printing device
into each second storage means.

18. A method for controlling a printing system
including a plurality of data processing devices and a
25 plurality of printing devices for executing a print job

when received a print job signal from any one of the plurality of printing devices, respectively comprising the steps of:

grouping the plurality of printing devices based on 5 processing languages employed in respective printing devices;

designating a managing printing device among the printing devices belonging to the same language group;

transmitting a status signal from each of all printing 10 devices belonging to the same language group to the managing printing device; and

transferring a print job signal received by a printing device being inoperative to execute a print job to another one of the printing devices of the same language group to 15 which the inoperative printing device belongs.

19. A method for controlling a printing system including a plurality of data processing devices and a plurality of printing devices for executing a print job 20 when received a print job signal from any one of the plurality of printing devices, respectively comprising the steps of:

grouping the plurality of printing devices based on 25 processing languages employed in respective printing devices;

designating a printing device capable of processing different languages in the plural language groups among the printing devices as a managing printing device;

transmitting a status signal from each of all printing
5 devices belonging to the same language group to the managing printing device; and

transferring a print job signal received by a printing device being inoperative to execute a print job to another one of the printing devices of the same language group to
10 which the inoperative printing device belongs.

20. A method for controlling a printing system including a plurality of data processing devices and a plurality of printing devices for executing a print job when received a print job signal from any one of the plurality of printing devices, respectively comprising the
15 steps of:

grouping the plurality of printing devices based on processing languages employed in respective printing
20 devices;

selectively designating either one of the printing devices belonging to the same language group or one printing device belonging to plural language groups as a managing printing device;

25 transmitting a status signal from each of all printing

devices belonging to the same language group to the managing printing device; and

transferring a print job signal received by a printing device being inoperative to execute a print job to another 5 one of the printing devices of the same language group to which the inoperative printing device belongs.

21. A printing system including a plurality of data processing devices and a plurality of printing devices for executing a printing operation when received a printing job signal from any one of the plurality of data processing 10 devices, respectively, comprising:

communication means for communicating data among the plurality of printing devices;

15 printing means provided in each of the plurality of printing devices for executing a print job based on the print job signal;

storage means for storing device information of other 20 printing devices; and

a controller for executing the following processings;

grouping the plurality of printing devices based on 25 processing languages employed in respective printing devices into plural language groups;

designating a printing device having the highest data processing capability among printing devices capable of

processing at least two different languages;
storing device information about all printing devices
belonging to each of the language groups processable by the
designated managing printing device; and
transferring a printing job data being transferred
from any printing device to another printing device
belonging to the same language group.

22. A printing system according to claim 21 wherein
the controller selects the managing printing device based
on the device information about the plurality of printing
devices, groups the plurality of printing devices based on
respective processing languages processable by the managing
printing device,
transmits device information about printing devices
belonging to respective processing languages processable by
the managing printing device and notifies information about
the managing printing device to all other printing devices
belonging to the respective language groups.

23. A printing system according to claim 22 further
comprising a manual selection means for selecting the
managing printing device manually and arbitrarily based on
the device information of the plurality of printing devices.

24. A printing system according to claim 21, wherein the controller transfers a print job data, when transferred from any printing device to the managing printing device, to a printing device having the lowest data processing 5 capability among the printing devices belonging to the same language group.

25. A printing device for executing a print job when received a printing job signal from any one of plural data 10 processing devices comprising:

printing means for executing a print job based on the printing job signal;

communication means for communication data between the printing device and other printing devices;

15 storage means for storing information about other printing devices having a processing language same as that of the printing device or a managing printing device managing the printing device; and

a controller for executing the following processings;

20 if the printing device itself has been selected as the managing printing device, storing device information regarding other printing devices belonging to the same language group into the storage means, and, if not, storing the managing printing device of the printing device, 25 storing device information regarding the managing printing

device;

if the printing device itself is not the managing printing device and is inoperative to execute a print job, transferring print job data to the managing printing device through the communication means; and

5 if the printing device itself is the managing printing device, transferring print job data to a printing device of the same language group which is operative to execute a print job.

10 26. A program product stored in a recording medium executable by a computer for controlling a printing system including a plurality of data processing devices and a plurality of printing devices each of which executes a print job when received a print job signal, said program product including a program for

15 grouping the plurality of printing devices based on processing languages employed in respective printing devices;

20 designating a printing device belonging to at least two language groups and having the highest data processing capability as a managing printing device;

storing device information regarding all printing devices belonging to individual language groups processable by the managing printing device; and

25

when print job data is transferred from any one of the printing devices, transferring the print job data to a printing device belonging to the same language group.

5 27. A program product according to claim 26 wherein further executes the following processings:

selecting a printing device belonging to at least two language groups and having the highest data processing capability among the printing devices belonging to at least 10 two language groups as a managing printing device;

grouping the plurality of printing devices based on processing languages processable by respective printing devices, and

15 transmitting device information regarding all printing devices belonging to the language groups processable by the managing printing device and notifying the managing printing device to printing devices belonging to each language group.

20 28. A program product according to claim 27 in which the managing printing device is manually and arbitrarily selectable among the plurality of printing devices.

25 29. A program product according to claim 26 in which the print job data, when transferred from any printing

DO NOT INDEX

device to the managing printing device, is transferred to a printing device having the lowest data processing capability among the printing devices belonging to the same language group.

5

30. A method for controlling a printing system including a plurality of data processing devices and a plurality of printing devices each executing a print job when received a print job signal, comprising steps of:

10 (a) grouping the plurality of printing devices based on processing languages employed in respective printing devices;

15 (b) designating a printing device belonging to at least two language groups and having the highest data processing capability among printing devices belonging to at least two language groups;

(c) storing device information regarding all printing devices belonging to respective language groups processable by the managing printing device; and

20 (d) transferring print job data, when transferred from any printing device, to another printing device belonging to the same language group.
